

IF YOU HAVE COWS, YOU NEED... Fight Bac®

The smart way to disinfect teats, plus use Fight Bac on calf navels, udder rot, cuts/wounds, injection sites, and to cleanse a teat prior to intramammary infusion.

Use Fight Bac as a post-milking teat disinfectant

Fight Bac is research proven to perform better than teat dips. Regular teat dips can leave milk residue that actually feeds mastitis-causing bacteria. Fight Bac's aerosol action blows away residual milk and completely disinfects the teat. It's fresh every use and there is no chance to spread infection, which is a common concern with a dirty dip cup.

Fight Bac is cost-effective too. It costs about the same as a mid-priced dip and two cans treat as many cows as a gallon of dip. Fight Bac is also approved for organic use.

Use Fight Bac on udder rot

When hoof trimmers see udder rot, they grab a can of Fight Bac. They know it works!

The photo above shows udder rot in the front portion of the udder cleft. Fight Bac owner Dr. Westfall says this type of udder rot often involves mites and he recommends Fight Bac, plus a pour-on treatment. For udder rot that is between the inside of the thigh and on the side of the udder, that is where Fight Bac truly shines because you can easily spray the disinfectant into this difficult-to-reach area.

Use Fight Bac on newborn calf navels

Fight Bac's antibacterial formula with chlorhexidine has been proven to be just as effective as 7% tincture of iodine, plus it's more available and costs a lot less. At about \$0.10 per navel, compared to navel dip at \$1.10 or more per navel, you can't afford not to use Fight Bac! One can will treat 150 navels (spray the navel generously). Fight Bac also is more convenient and less messy than using iodine in a dip cup (or paper cup) — no gloves are needed and there is no chance to spread infection.

For years now, hospitals have turned away from iodine and switched to chlorhexidine for treating human baby umbilical cords. It simply is a better antibacterial.

Put a can in every corner

For decades, producers have had excellent results with Fight Bac as an effective and affordable teat disinfectant. Now it's also being used as a general disinfectant all around the farm, including on calf navels, udder rot, cuts, wounds, injection sites, and to cleanse a teat prior to intramammary infusion. If you have cows, you need a can in every corner.
